Regression Tables with huxreg

David Hugh-Jones

2018-02-13

Regression tables with `huxreg`

From version 0.2, huxtable includes the function `huxreg` to build a table of regressions.

`huxreg` can be called with a list of models. These models can be of any class which has a `tidy` method defined in the broom package. The method should return a list of regression coefficients with names `term`, `estimate`, `std.error` and `p.value`. That covers most standard regression packages.

Let's start by running some regressions to predict a diamond's price.

```
data(diamonds, package = 'ggplot2')

lm1 <- lm(price ~ carat + depth, diamonds)
lm2 <- lm(price ~ depth + factor(color, ordered = FALSE), diamonds)
lm3 <- lm(log(price) ~ carat + depth, diamonds)
```

Now, we call `huxreg` to display the regression output side by side.

```
huxreg(lm1, lm2, lm3)
```

	(1)	(2)	(3)

*** p < 0.001; ** p < 0.01; * p < 0.05.

The basic output includes estimates, standard errors and summary statistics.

Some of those variable names are hard to read. We can change them by specifying a named list of variables in the `coefs` argument, like this:

```
color_names <- paste0('factor(color, ordered = FALSE)', LETTERS[5:10])
names(color_names) <- paste('Color:', LETTERS[5:10])

huxreg(lm1, lm2, lm3, coefs = c('Carat' = 'carat', 'Depth' = 'depth', color_names))
```

	(1)	(2)	(3)
Carat	7765.141 ***		1.971 ***
	(14.009)		(0.004)
Depth	-102.165 ***	-53.835 ***	-0.018 ***
	(4.635)	(11.815)	(0.001)

*** p < 0.001; ** p < 0.01; * p < 0.05.

Alternatively, since the output from `huxreg` is just a huxtable, we could just edit its contents directly before we print it:

```
diamond_regs <- huxreg(lm1, lm2, lm3)
diamond_regs[seq(8, 18, 2), 1] <- paste('Color:', LETTERS[5:10])
diamond_regs
```

	(1)	(2)	(3)
(Intercept)	4045.333 ***	6491.466 ***	7.313 ***
	(286.205)	(730.537)	(0.074)

		(71.561)	
Color: J		2164.044 ***	
		(88.144)	
N	53940	53940	53940
R 2	0.851	0.032	0.847
logLik	-472488.441	-522908.139	-26617.649
AIC	944984.882	1045834.277	53243.298

*** p < 0.001; ** p < 0.01; * p < 0.05.

Of course, we aren't limited to just changing names. We can also make our table prettier. Let's add the "article" theme, and a vertical stripe for background colour, tweak a few details like font size, and add a caption. All of these are just standard huxtable commands.

```
suppressPackageStartupMessages(library(dplyr))
diamond_regs                                                    %>%
      theme_article                                             %>%
      set_background_color(1:nrow(diamond_regs), evens, grey(.95)) %>%
      set_font_size(final(), 1, 9)                              %>%
      set_bold(final(), 1, FALSE)                               %>%
      set_top_border(final(), 1, 1)                             %>%
      set_caption('Linear regressions of diamond prices')
```

Table 1: Linear regressions of diamond prices

*** p < 0.001; ** p < 0.01; * p < 0.05.

We could do more, like changing the `number_format` of N to not display decimals. But let's explore what else `huxreg` itself can do.

By default, standard errors are shown below coefficient estimates. To display them in a column to the right, use `error_pos = 'right'`:

```
huxreg(lm1, lm3, error_pos = 'right')
```

	(1)		(2)	
(Intercept)	4045.333 ***	(286.205)	7.313 ***	(0.074)
carat	7765.141 ***	(14.009)	1.971 ***	(0.004)
depth	-102.165 ***	(4.635)	-0.018 ***	(0.001)
N	53940		53940	
R 2	0.851		0.847	
logLik	-472488.441		-26617.649	
AIC	944984.882		53243.298	

*** p < 0.001; ** p < 0.01; * p < 0.05.

This will give column headings a column span of 2.

To display standard errors in the same cell as estimates, use `error_pos = 'same'`:

```
huxreg(lm1, lm3, error_pos = 'same')
```

	(1)	(2)
(Intercept)	4045.333 *** (286.205)	7.313 *** (0.074)
carat	7765.141 *** (14.009)	1.971 *** (0.004)
depth	-102.165 *** (4.635)	-0.018 *** (0.001)
N	53940	53940
R 2	0.851	0.847
logLik	-472488.441	-26617.649
AIC	944984.882	53243.298

*** p < 0.001; ** p < 0.01; * p < 0.05.

You can change the default column headings by giving names to your models:

```
huxreg('Price' = lm1, 'Log price' = lm3)
```

	Price	Log price
(Intercept)	4045.333 ***	7.313 ***
	(286.205)	(0.074)
carat	7765.141 ***	1.971 ***
	(14.009)	(0.004)
depth	-102.165 ***	-0.018 ***
	(4.635)	(0.001)
N	53940	53940
R 2	0.851	0.847
logLik	-472488.441	-26617.649
AIC	944984.882	53243.298

*** p < 0.001; ** p < 0.01; * p < 0.05.

To display a particular row of summary statistics, use the `statistics` parameter. This should be a character vector. Valid values are anything returned from your models by `broom::glance`. Another valid value is `"nobs"`, which returns the number of observations from the regression. If the `statistics` vector has names, these will be used for row headings:

```
broom::glance(lm1)
```

```
##   r.squared adj.r.squared    sigma statistic p.value df    logLik      AIC
## 1 0.8506755     0.8506699 1541.649  153634.8       0  3 -472488.4 944984.9
##        BIC     deviance df.residual
## 1 945020.5 128191108498       53937
```

```
huxreg(lm1, lm3, statistics = c('# observations' = 'nobs', 'R squared' = 'r.squared', 'F statistic' = '
  'P value' = 'p.value'))
```

	(1)	(2)
(Intercept)	4045.333 ***	7.313 ***
	(286.205)	(0.074)
carat	7765.141 ***	1.971 ***
	(14.009)	(0.004)
depth	-102.165 ***	-0.018 ***
	(4.635)	(0.001)
# observations	53940	53940

P value	0.000	0.000

*** p < 0.001; ** p < 0.01; * p < 0.05.

By default, `huxreg` displays significance stars. You can alter the symbols used and significance levels with the `stars` parameter, or set `stars = NULL` to turn off significance stars completely.

```
huxreg(lm1, lm3, stars = c(`*` = 0.1, `**` = 0.05, `***` = 0.01)) # a little boastful?
```

	(1)	(2)

.

You aren't limited to displaying standard errors of the estimates. If you prefer, you can display t statistics or p values, using the `error_format` option. Any column from `tidy` can be used by putting it in curly brackets:

```
huxreg(lm1, lm3, error_format = '({statistic})')
```

	(1)	(2)
(Intercept)	4045.333 ***	7.313 ***
	(14.134)	(99.383)
carat	7765.141 ***	1.971 ***

*** p < 0.001; ** p < 0.01; * p < 0.05.

Or you can display confidence intervals. Use `ci_level` to set the confidence level for the interval, then use `{conf.low}` and `{conf.high}` in `error_format`:

```
huxreg(lm1, lm3, ci_level = .99, error_format = '{conf.low} to {conf.high}')
```

	(1)	(2)
(Intercept)	4045.333 ***	7.313 ***
	3308.117 to 4782.549	7.123 to 7.502
carat	7765.141 ***	1.971 ***
	7729.055 to 7801.226	1.962 to 1.981
depth	-102.165 ***	-0.018 ***
	-114.105 to -90.226	-0.021 to -0.015
N	53940	53940
R 2	0.851	0.847
logLik	-472488.441	-26617.649
AIC	944984.882	53243.298

*** p < 0.001; ** p < 0.01; * p < 0.05.

To change the footnote, use `note`. If `note` contains the string `"{stars}"` it will be replaced by a description of the significance stars used. If you don't want a footnote, just set `note = NULL`.

```
huxreg(lm1, lm3, note = 'Linear regressions on diamond price. {stars}.')
```

	(1)	(2)
(Intercept)	4045.333 ***	7.313 ***

Linear regressions on diamond price. *** p < 0.001; ** p < 0.01; * p < 0.05.

To change number formatting, set the `number_format` parameter. This works the same as the `number_format` property for a huxtable - if it is numeric, numbers will be rounded to that many decimal places; if it is character, it will be taken as a format to the base R `sprintf` function; if it is a function, the function will be called to format the number. `huxreg` tries to be smart and to format summary statistics like `nobs` as integers.

```
huxreg(lm1, lm3, number_format = 2)
```

	(1)	(2)
